1. Introduction

1.1 Purpose of this Document

The purpose of this Software Requirements Specification (SRS) is to provide a detailed description of the Sketch Online Ordering System, its parameters, and its goals. This document describes the target users of the system, its user interfaces, and its functional and non-functional requirements. It defines how the client, the development team, and the users see the product and its functionality, and it is intended for everyone who will design, build, or test the system.

1.2 Scope of the Development Project

The goal is to develop an online ordering platform for Sketch cafe. A customer can browse the menu, manage a cart, place an order using a phone number, pay online through UPI, and track the order until it is ready to be picked up at the cafe. Cafe staff view incoming paid orders and update their status. The cafe admin manages menu items, categories, prices, staff accounts, reports, and customer feedback.

The software must be able to perform the following operations:

1. **Display the menu:** It must show menu items with their details and availability, and allow customers to search them.
2. **Manage the cart:** It must let customers add items, remove items, and change quantities before placing an order.
3. **Place an order:** It must create an order from the cart using the customer's phone number.
4. **Process payment:** It must collect payment through a UPI payment gateway, verify the result, and issue a receipt.
5. **Track orders:** It must show the order status to the customer and send a notification whenever the status changes.
6. **Manage orders:** It must let staff process paid orders, update their status, and review order history.
7. **Administer the system:** It must let the admin maintain the menu, staff accounts, and reports, and read customer feedback.
8. **Collect feedback:** It must collect customer ratings, reviews, and support requests.

The following are not part of this project: customer accounts, order cancellation, refunds, delivery and delivery tracking, and pickup-slot scheduling. Customers collect their orders from the cafe.

1.3 Definitions, Abbreviations and Acronyms

Table 1 explains the most commonly used terms in this SRS document.

Table 1: Definitions for most commonly used terms

S.No.	Term	Definition
1	SRS	Software Requirements Specification.
2	Sketch	The cafe for which the system is built.
3	UPI	Unified Payments Interface, an instant digital payment method used in India.
4	Payment Gateway	An external service that processes UPI payments and returns the transaction result.
5	Customer	A person who orders from Sketch. Customers do not need an account.
6	Cafe Staff	A cafe employee who handles incoming orders and item availability.
7	Cafe Admin	A cafe employee who manages the menu, staff accounts, reports, and customer feedback.
8	Order Status	The stage an order has reached: Pending Payment, Paid, Preparing, Ready, or Completed.
9	DFD	Data Flow Diagram.

[2]. Sketch Online Ordering System design diagrams: Use Case Diagram, Level 0 Data Flow Diagram, and Level 1 Data Flow Diagram.

1.5 Overview

The remaining sections of this document provide a general description of the system, the characteristics of its users, and its functional and data requirements. Section 2 gives the general description, including the product perspective, product functions, user characteristics, the constraints, assumptions, and dependencies, and the

apportioning of requirements. Section 3 gives the specific requirements: external interface requirements, detailed functional requirements, performance requirements, logical database requirements, quality attributes, and other requirements, including the business rules. Section 4 describes the behaviour of the system through use cases, data flow, and the order of operations. Section 5 gives the acceptance criteria.

2. Overall Description

2.1 Product Perspective

The product is a standalone web application used through a browser on a phone, tablet, or computer. It interacts with two external services: a UPI payment gateway, which processes payments, and a notification provider, which delivers order messages to customers. All data is kept in the system's own database.

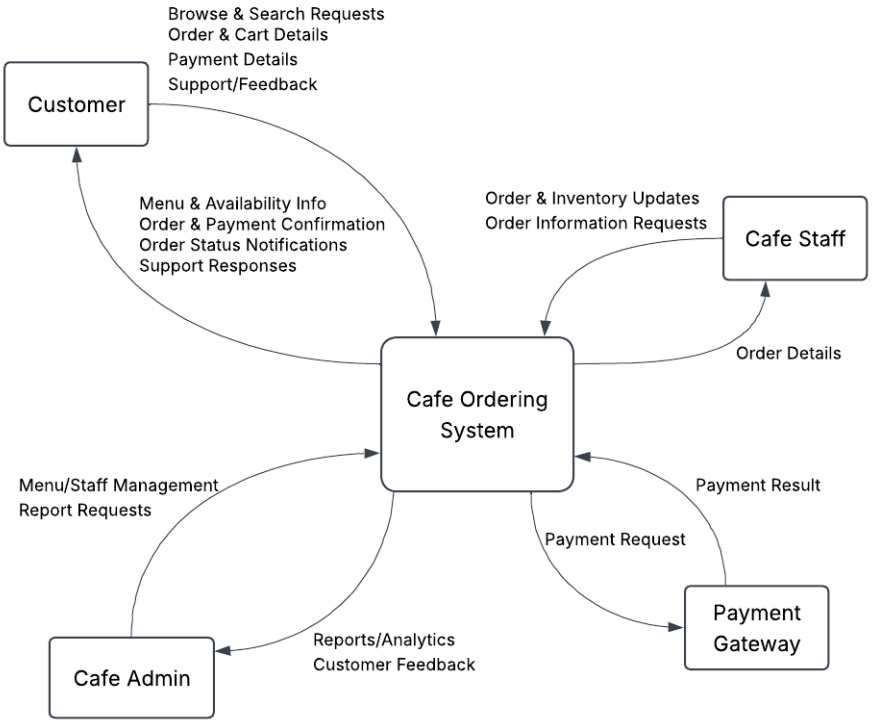

Figure 1: Level 0 Data Flow Diagram of the Sketch Online Ordering System

Figure 1 shows the system at the highest level as one process that exchanges data with four external parties. The customer sends browse and search requests, cart and order details, payment details, and feedback, and receives menu and availability information, order and payment confirmations, order status notifications, and support

responses. Cafe staff send order and inventory updates and receive order details. The cafe admin sends menu and staff management actions and report requests, and receives reports, analytics, and customer feedback. The payment gateway receives payment requests and returns payment results.

2.2 Product Functions

The product is organised into six functional areas, summarised in Table 2 and described further in Section 4.2.

Table 2: Functional areas of the product

S.No.	Functional Area	Description
1	Menu and Cart Management	Browsing and searching the menu, viewing item details, and adding, removing, or changing items in the cart.
2	Order Management	Creating orders from the cart, confirming them, and tracking their status.
3	Payment Processing	Sending UPI payment requests to the gateway, verifying results, issuing receipts, and handling retries.
4	Notification and Feedback Management	Sending status notifications and receipts, and collecting ratings, reviews, and support requests.
5	Cafe Operations	Staff handling of paid orders, status updates, item availability, order history, and daily summaries.
6	Administration	Menu, price, and staff-account management, reports, analytics, and review of customer feedback.

2.3 User Characteristics

The goal is to develop software that is easy to use for every type of user. The system has three types of human users and one external actor, listed in Table 3. No user is expected to need formal training.

Table 3: User types and their characteristics

S.No.	User	Characteristics	Access
1	Customer	Any person who wants to order from Sketch. Customers do not register or log in; they give a phone number when placing an order or submitting a support request. They are assumed to be able to use a web browser and a UPI payment application.	Menu, cart, ordering, payment, order tracking, reviews, and support requests.
2	Cafe Staff	Cafe employees who log in to handle orders. They are assumed to be comfortable using a web page on a tablet or computer during busy hours.	Incoming paid orders, status updates, item availability, order history, and daily summaries.
3	Cafe Admin	The cafe manager or owner, who logs in to run the system.	Menu items, categories, prices, staff accounts, reports, analytics, and customer feedback.
4	Payment Gateway	A non-human external actor.	Processes UPI payments and returns the transaction result.

Cafe staff and cafe admin use the same login mechanism but have different permissions.

2.4 General Constraints, Assumptions and Dependencies

The following constraints, assumptions, and dependencies apply to the implementation of the Sketch Online Ordering System:

- **Constraint:** Development of the system is planned over a period of three months.
- **Constraint:** Online payment is limited to UPI through the external payment gateway.
- **Constraint:** The system needs an internet connection for customers, staff, and admin.

- **Dependency:** Order notifications depend on a third-party notification provider.
- **Assumption:** Customers have a UPI-enabled payment application and enter a correct phone number so that notifications can reach them.
- **Assumption:** At least one staff member watches the staff screen during opening hours.
- **Assumption:** The system serves one cafe, with one admin account and one or more staff accounts.
- **Outside the system's control:** Physical food preparation, quality, and preparation time; payment-provider infrastructure, including gateway downtime and bank or UPI disputes; and the availability of the notification provider.

Sections 3 and 4 list what the system must implement and test. The assumptions above are conditions taken to be true; the system does not enforce them.

2.5 Apportioning of Requirements

The Sketch Online Ordering System is to be implemented in three phases within the planned three-month development period, as summarised in Table 4. All requirements in Section 3 are delivered by the end of Phase 3; the phases only decide the order in which they are built, so that each phase produces something that can be tested.

Table 4: Phasing of requirements

S.No.	Phase	Period	Requirements Covered
1	Phase 1: Core ordering and payment	Month 1	Staff and admin login, admin menu management, menu browsing, cart management, order placement, and UPI payment with verification and receipts.
2	Phase 2: Order handling	Month 2	Order tracking and customer notifications, staff order management, and item availability.
3	Phase 3: Administration and feedback	Month 3	Staff account management, reports and analytics, ratings, reviews, support requests, and final acceptance testing.

3. Specific Requirements

3.1 External Interface Requirements

Table 5 lists the external interfaces of the system.

Table 5: External interfaces

S.No.	Interface	Description
1	Customer ordering interface	A web interface with pages for the menu, item details, cart, order summary, payment, order confirmation, order tracking, reviews, and support. It works on mobile and desktop browsers and needs no login.
2	Staff and admin interface	A web interface reached through a login page. After login, users see only the screens allowed for their role: the order queue, availability, and history for staff, and the menu, staff, reports, and feedback screens for the admin.
3	Database	Stores all menu, order, payment, review, support, and employee data. Only the system accesses the database.
4	Payment gateway	The system sends the amount and an order reference and receives the transaction result (success, failure, or pending) with a transaction reference. The result is verified before the order is updated.
5	Notification service	A system service that sends order status updates and receipts to the customer's phone number through a suitable notification provider. The choice of provider is left to the design phase.

3.2 Detailed Description of Functional Requirements

Table 6 shows the template used to describe the functional requirements. Each feature is described by its purpose, inputs, processing, and outputs.

Table 6: Template for describing functional requirements

Item	Description
Purpose	A description of the functional requirement and the reason for it.
Inputs	What the inputs are, the form in which they arrive, and which users or systems provide them.
Processing	The outcome of the operation, including validity checks on the data and how unexpected or abnormal situations are handled.
Outputs	What the system displays, stores, or sends as a result.

3.2.1 Functional Requirements for Authentication

Table 7 gives the functional requirements for Authentication.

Table 7: Functional requirements for Authentication

Item	Description
Purpose	Lets cafe staff and cafe admin log in so that only authorised people use the management features. Both use the same login, and the role of the user decides which features they can open.
Inputs	A username and password entered on the login page, and log out and change-password requests from a logged-in user.
Processing	The system checks the credentials against the stored employee account. Inactive accounts are refused. On success it opens the screens allowed for the user's role. On failure it shows an error message. A user can log out or change their own password at any time, and idle sessions expire.
Outputs	The staff or admin home screen, or a login error message.

3.2.2 Functional Requirements for Menu Browsing

Table 8 gives the functional requirements for Menu Browsing.

Table 8: Functional requirements for Menu Browsing

Item	Description
Purpose	Lets customers look through the menu without logging in. Items are grouped by category.
Inputs	A request to open the menu, a category selection, a search or filter keyword, or a selected item.
Processing	The system lists the items by category with name, description, price, and image if available. Unavailable items are clearly marked and cannot be added to the cart. Search and filter match item names and keywords. Selecting an item opens its full details.
Outputs	A menu page, search results, or an item details page that shows the current availability.

3.2.3 Functional Requirements for Cart Management

Table 9 gives the functional requirements for Cart Management.

Table 9: Functional requirements for Cart Management

Item	Description
Purpose	Holds the items a customer plans to order. The cart can be changed freely until the order is placed.
Inputs	Add, remove, and change-quantity actions on available menu items.
Processing	After every change the system recalculates the item subtotals and the cart total. If an item becomes unavailable before the order is placed, the customer is told.
Outputs	The updated cart with items, quantities, subtotals, and total.

3.2.4 Functional Requirements for Order Placement

Table 10 gives the functional requirements for Order Placement.

Table 10: Functional requirements for Order Placement

Item	Description
Purpose	Turns the cart into an order.
Inputs	The customer's name and phone number and a request to place the order.
Processing	The system checks that the cart is not empty and that the phone number is valid. It then creates the order with a unique order ID, the items, quantities, unit prices, and total amount, and shows an order summary with the amount due. Once placed, an order cannot be cancelled, and the system offers no cancel option.
Outputs	An order summary with the order ID and amount due, and an order confirmation once payment succeeds.

3.2.5 Functional Requirements for Payment

Table 11 gives the functional requirements for Payment.

Table 11: Functional requirements for Payment

Item	Description
Purpose	Collects payment for the order through UPI using the external payment gateway. An order counts as paid only after the result has been verified.
Inputs	The order ID and amount sent to the gateway, the customer's payment action in their UPI application, the transaction result returned by the gateway, and a retry request.
Processing	The system sends the payment request to the gateway and verifies the returned result before marking the order Paid. It records the payment amount, transaction reference, status, and time. If the payment fails, the order stays in Pending Payment status and is not shown to staff, and the customer can retry. Refunds are not supported.
Outputs	A payment confirmation and receipt on screen and by notification, or a payment failure message with the option to retry.

3.2.6 Functional Requirements for Order Tracking and Notifications

Table 12 gives the functional requirements for Order Tracking and Notifications.

Table 12: Functional requirements for Order Tracking and Notifications

Item	Description
Purpose	Lets customers follow the progress of an order and tells them when it changes.
Inputs	The order ID and phone number entered by the customer, and status changes made by staff.
Processing	The system finds the order and shows its current status: Pending Payment, Paid, Preparing, Ready, or Completed. Every status change is recorded with its time, and a notification is sent to the customer's phone number. The Ready notification tells the customer that the order can be picked up at the cafe.
Outputs	The order status page and status notifications.

3.2.7 Functional Requirements for Staff Order Management

Table 13 gives the functional requirements for Staff Order Management.

Table 13: Functional requirements for Staff Order Management

Item	Description
Purpose	Gives staff a working list of paid orders and lets them move each order through preparation.
Inputs	A staff selection of an order, a new status, an item availability change, or a history filter by date or status.
Processing	Only orders with verified payment appear in the list. Staff update the status in sequence: Paid, Preparing, Ready, Completed. Each update triggers a customer notification. Staff can mark items available or unavailable, which immediately changes the customer menu, and can view order history and a daily summary of orders handled and total sales.
Outputs	The incoming order list, order details, the updated status, order history, and the daily summary.

3.2.8 Functional Requirements for Menu Management

Table 14 gives the functional requirements for Menu Management.

Table 14: Functional requirements for Menu Management

Item	Description
Purpose	Lets the cafe admin keep the menu accurate.
Inputs	Category and item details (name, description, image, category, and price) and availability settings.
Processing	The admin can add, edit, and remove categories and items, change prices, and set availability. A price change applies only to new orders. Existing orders keep the price they were placed with.
Outputs	The updated menu as shown to customers, and confirmation messages.

3.2.9 Functional Requirements for Staff Accounts, Reports, and Feedback

Table 15 gives the functional requirements for Staff Accounts, Reports, and Feedback.

Table 15: Functional requirements for Staff Accounts, Reports, and Feedback

Item	Description
Purpose	Lets the cafe admin control who can use the staff screens and see how the cafe is performing.
Inputs	Staff account details, password reset requests, a report date range, and requests to view feedback.
Processing	The admin can create, edit, deactivate, and reactivate staff accounts and reset passwords. Sales and order reports are produced for the chosen date range, together with basic analytics such as best-selling items and orders per day. Customer ratings, reviews, and support requests can be viewed.
Outputs	The staff account list, reports and analytics, and customer feedback.

3.2.10 Functional Requirements for Ratings, Reviews, and Support

Table 16 gives the functional requirements for Ratings, Reviews, and Support.

Table 16: Functional requirements for Ratings, Reviews, and Support

Item	Description
Purpose	Collects feedback from customers and lets them ask for help.
Inputs	A rating from 1 to 5 with an optional comment for a Completed order, or a phone number and message for a support request.
Processing	A customer can leave one review per order, and only after the order is Completed. Reviews and support requests are stored for the admin. A support request carries a status so that it can be marked as resolved.
Outputs	A confirmation message for the customer, and stored records visible to the admin.

3.3 Performance Requirements

- Menu and cart pages load within 3 seconds under normal load.
- The system handles at least 50 customers at the same time without noticeable slowdown.

- A newly paid order appears on the staff screen within 10 seconds of payment verification.
- Status notifications are handed to the notification provider within 30 seconds of the status change.

3.4 Logical Database Requirements

The system stores all of its data in a database. Table 17 lists the main entities and their purposes. A cart contains cart items and is used to place at most one order. An order contains one or more order items, can have several payment records, has at most one review, and can have any number of support requests. A category groups menu items. Employee is specialised into CafeStaff and CafeAdmin.

Table 17: Main data entities

S.No.	Entity	Description
1	MenuCategory	A named group of menu items, such as Beverages or Snacks.
2	MenuItem	A single item with its name, description, price, and availability. Each item belongs to one category.
3	Cart	A customer's temporary list of items before an order is placed.
4	CartItem	One menu item and its quantity inside a cart.
5	Order	A placed order with its order ID, customer phone number, total amount, status, and creation time. It is created from one cart.
6	OrderItem	One menu item, its quantity, and the unit price at the time of ordering.
7	Payment	A payment attempt for an order, with amount, transaction ID, status, and date. An order can have several payment records because failed payments can be retried.
8	Review	The rating and comment a customer leaves for an order.
9	SupportRequest	A customer's phone number and message, with a status so that the admin can resolve it.
10	Employee	A person who can log in, with a username, hashed password, and active flag. CafeStaff handle orders and item availability; CafeAdmin manage the menu, pricing, staff accounts, and reports.

3.5 Quality Attributes

The system is intended for a wide range of users, so it must be simple to use, dependable, and secure. Table 18 lists the quality attributes.

Table 18: Quality attributes

S.No.	Attribute	Description
1	Usability	A first-time customer can place an order without instructions.
2	Usability	The customer interface works on common mobile and desktop browsers.
3	Usability	Error messages are clear and tell the user what to fix.
4	Reliability	The system is available during the cafe's opening hours, with a target of 95% availability.
5	Reliability	If the payment gateway or notification provider is unavailable, the system shows a clear message and keeps the cart and order intact.
6	Security	Staff and admin passwords are stored using hashing, never as plain text.
7	Security	Payment results are verified with the payment gateway on the server before an order is marked as paid.
8	Security	All traffic between users and the system uses HTTPS.
9	Security	UPI PINs and other sensitive payment credentials are never stored.
10	Access Control	Every staff and admin request is checked against the user's role, and unauthorised administrative actions are rejected.
11	Access Control	Staff and admin sessions expire after a period of inactivity.
12	Data Integrity	An order is never marked Paid without a verified successful payment.
13	Data Integrity	Staff cannot edit or delete order and payment records.
14	Data Integrity	A repeated payment result for the same order does not create a duplicate order or payment.
15	Maintainability	The system is built in separate, commented modules so that features can be changed independently.
16	Maintainability	The database supports regular backups.

3.6 Other Requirements

The business rules in Table 19 apply across the whole system. There are no other requirements at this time.

Table 19: Business rules

S.No.	Business Rule
1	Customers do not need an account or login.
2	Payment must succeed before cafe staff begin preparing an order.
3	Customers cannot cancel an order after placing it.
4	Refunds are not supported.
5	Cart changes are allowed before the order is placed.
6	Item availability is reflected in the ordering interface at all times.
7	Only authorised staff and admins can access their respective management features.
8	Customers pick up their orders at the café.

4. Use Cases and System Behaviour

4.1 Use Cases

Figure 2 shows the use case diagram. Customers need no login; cafe staff and cafe admin log in first. Table 20 summarises the main use cases.

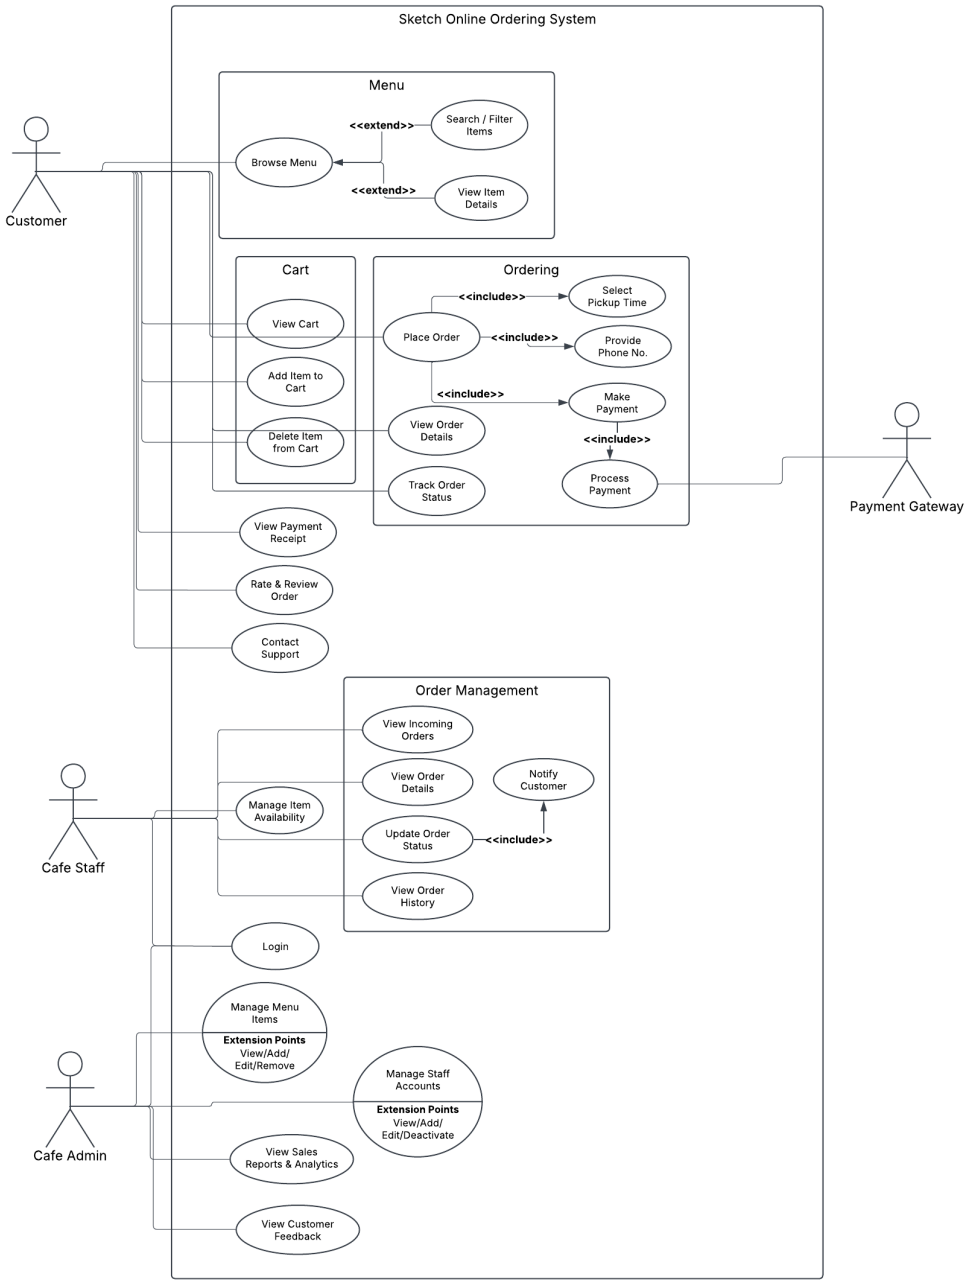

Figure 2: Use Case Diagram of the Sketch Online Ordering System

Table 20: Summary of main use cases

S.No.	Use Case	Actor	Description
1	Browse Menu	Customer	View the menu, search or filter items, and open item details.
2	Manage Cart	Customer	View the cart, add items, and delete items.
3	Place Order	Customer, Payment Gateway	Give a phone number, review the order, and pay. Payment is processed by the payment gateway.
4	Track Order and View Receipt	Customer	Check the current order status and view the payment receipt.
5	Rate, Review, and Contact Support	Customer	Send feedback about an order or ask for help.
6	Process Orders	Cafe Staff	View incoming orders and their details, update the order status (which notifies the customer), and view order history.
7	Manage Item Availability	Cafe Staff	Mark items as available or unavailable.
8	Manage Menu Items and Staff Accounts	Cafe Admin	View, add, edit, and remove menu items; view, add, edit, and deactivate staff accounts.
9	View Reports and Feedback	Cafe Admin	View sales reports, analytics, and customer feedback.

Table 21 describes the main use case, Place Order and Pay, in detail.

Table 21: Use case: Place Order and Pay

Item	Description
Actors	Customer, Payment Gateway
Precondition	The cart holds at least one available item.
Main flow	1. The customer chooses to place the order and enters a phone number. 2. The system creates the order and shows the order ID and amount due. 3. The customer chooses UPI payment, and the system sends the request to the gateway. 4. The customer completes the payment in their UPI application. 5. The system verifies the payment result, marks the order Paid, and records the payment. 6. The system shows the receipt and confirmation and sends a notification. The order appears in the staff queue.

Item	Description
Alternate flow	If the payment fails, the system shows a failure message, keeps the order in Pending Payment status, and lets the customer try again.
Postcondition	A verified, paid order exists and is visible to staff.

4.2 Data Flow

The Level 1 data flow diagram (Figure 3) splits the system into the six processes listed in Table 22, which read and write the five data stores listed in Table 23.

Table 22: Processes in the Level 1 data flow diagram

S.No.	Process	Description
1	1.0 Menu and Cart Management	Reads menu data, answers browse and search requests, and passes the selected items to order management.
2	2.0 Order Management	Saves the order, passes a payment request to payment processing, and returns order confirmation and tracking information.
3	3.0 Payment Processing	Sends the payment request to the gateway, stores the result, and returns the payment status and receipt.
4	4.0 Notification and Feedback Management	Sends status messages and receipts, and stores ratings, reviews, and support requests.
5	5.0 Cafe Operations	Reads confirmed orders for staff and writes order status and item availability updates.
6	6.0 Administration	Manages menu, pricing, and staff accounts, and reads orders, payments, and feedback to produce reports.

Table 23: Data stores in the Level 1 data flow diagram

S.No.	Data Store	Contents
1	D1 Order Data	Orders, order items, and their status history.
2	D2 Menu Data	Categories, menu items, prices, and availability.
3	D3 Staff Data	Staff and admin accounts.
4	D4 Payment Data	Payment attempts and transaction results.
5	D5 Feedback Data	Ratings, reviews, and support requests.

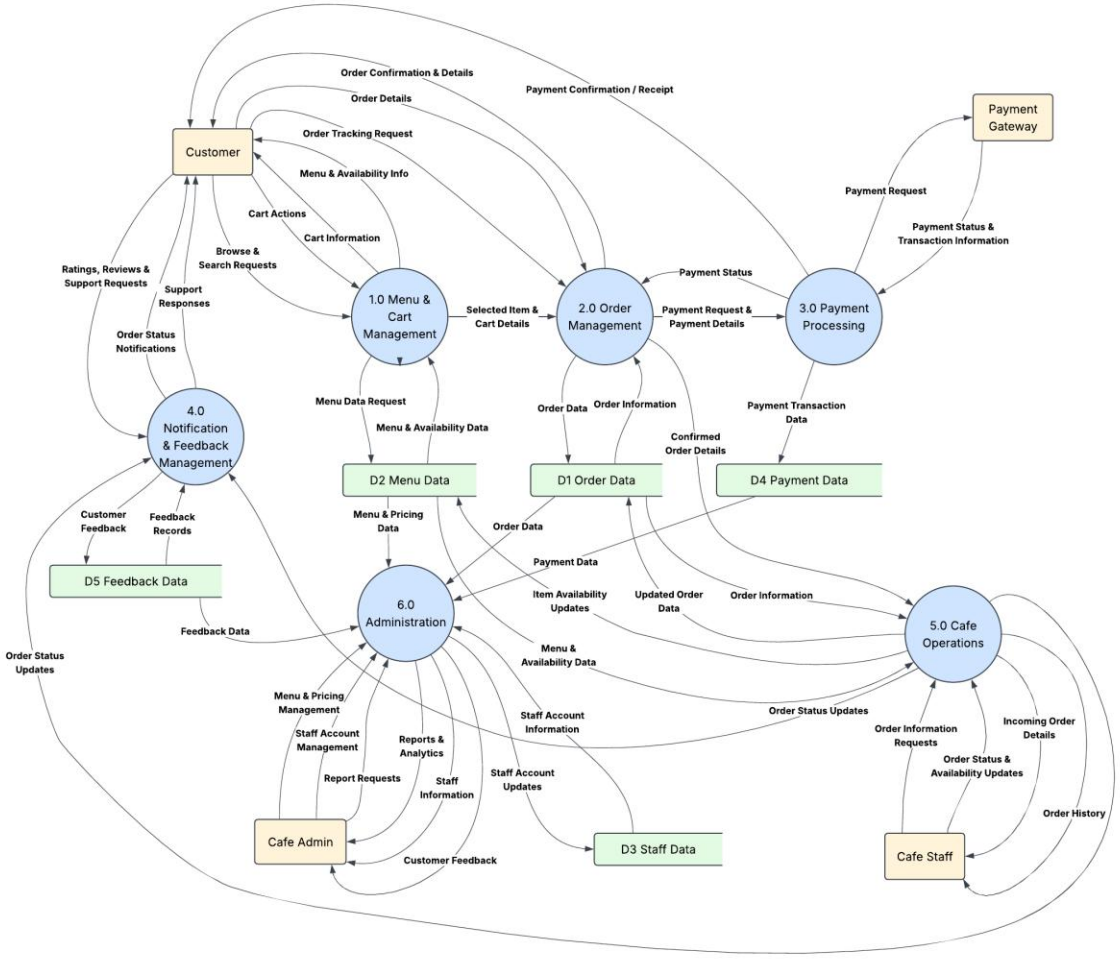

Figure 3: Level 1 Data Flow Diagram of the Sketch Online Ordering System

4.3 Order of Operations

The typical sequence of operations, from browsing to review, is as follows:

1. The customer browses the menu and changes the cart.
2. The customer places the order with a phone number, and the system saves the order.
3. The system starts the UPI payment with the payment gateway.
4. If the payment succeeds, the system confirms and saves the order and sends a confirmation and receipt. If it fails, the system shows the failure and the customer can retry.
5. Cafe staff view the paid orders and update the status step by step.
6. Each status update sends a notification to the customer, who can also check the status at any time.

7. After the order is completed, the customer can submit a review, or send a support request at any time.

5. Acceptance Criteria

The system is accepted when the checks in Table 24 pass.

Table 24: Acceptance criteria

S.No.	Acceptance Criterion	Section
1	A customer can browse, search, and view items without logging in, and unavailable items cannot be added to the cart.	3.2.2, 3.6
2	Cart totals update correctly when items are added, removed, or changed.	3.2.3
3	An order cannot be placed with an empty cart or without a valid phone number.	3.2.4
4	After a successful UPI payment, the order is marked Paid only once the result has been verified, and a receipt is shown and sent.	3.2.5, 3.5
5	After a failed payment, the order stays in Pending Payment status, does not appear in the staff queue, and the customer can retry.	3.2.5
6	The customer is notified of each status change and can view the status on the tracking page.	3.2.6
7	Staff see only paid orders and can update statuses in sequence.	3.2.7, 3.6
8	The system offers customers no cancel or refund option.	3.2.4, 3.6
9	Menu, price, and availability changes made by the admin appear in the customer interface, and a price change does not alter existing orders.	3.2.8
10	A staff user cannot open admin-only features, even by entering the page address directly.	3.2.1, 3.5
11	Staff and admin passwords are not stored as plain text.	3.5
12	A customer can submit one review for a Completed order and a support request with a phone number, and the admin can view both.	3.2.9, 3.2.10
